AI Automation Hub

AI Automation Hub is a lightweight platform designed to automate real business workflows using event triggers, external integrations, and AI-powered decision making.
It provides a clean architecture for connecting services (email, documents, messaging tools), interpreting content with AI, and executing automated actions.

🚀 Purpose

The goal of this project is to demonstrate practical AI integration in real-world scenarios.
It focuses on automating repetitive tasks, improving operational efficiency, and enabling intelligent workflows that combine:

- Event-based triggers
- AI interpretation (classification, summarization, extraction)
- Executable actions across external services
- Clear logging and workflow monitoring

🧩 Core Features

- Workflow builder: “When X happens → use AI → perform Y”
- AI-powered classification, summarization, and structured extraction
- Integrations with external APIs (email, notes, messaging, storage)
- Modular provider layer (OpenAI, Groq, Gemini, local models)
- Clean backend architecture (Node.js + TypeScript)
- Dashboard for workflow management and execution logs

🛠 Tech Stack

- **Frontend:** React + Tailwind
- **Backend:** Node.js + TypeScript
- **Database & Auth:** Supabase (PostgreSQL)
- **AI Providers:** OpenAI, Groq, Gemini, Ollama (switchable)
- **Integrations:** Gmail, Notion, Slack, Drive (planned)

📦 Project Goals

This project is part of a 3-month portfolio plan focused on:

1. AI automation
2. Applied AI architectures
3. Full-stack engineering with clean, scalable design

It is intentionally built to be extendable, provider-agnostic, and production-oriented.

📄 Status

Currently in active development.
Documentation, architecture diagrams, and workflow examples will be added progressively.
